INTRODUCTION

Medicinal herbs are an important source for the therapeutic remedies of various ailments. Medicinal plants constitute effective sources of antimicrobial and antioxidant natural products. Natural phytochemicals derived from medicinal plants have gained significant recognition in the potential management of several human clinical conditions, including cancer. Many of these indigenous medicinal plants are used as spices and food plants. They are also sometimes added to foods meant for pregnant and nursing mothers for medicinal purposes. Medicinal plants contain some organic compounds which provide definite physiological action on the human body and these bioactive substances include tannins, alkaloids, carbohydrates, terpenoids, steroids and flavonoids. According to World Health Organization (WHO), medicinal plants would be the best source to obtain variety of drugs. About 80% of individuals from developed countries used traditional medicines, which have compounds derived from medicinal plants.

Ziziphus glabrata Heyne (Syn: Z. Trinervia Roxb), is a small tree that grows up to 30 ft in height, having olive-brown wood and commonly found in the forests of Peninsular India and Bhutan. The leaves and aerial parts of the plant are traditionally used to treat inflammation, to relieve pain, convulsions and viral infections. Plants belonging to the genus Zizyphus (Rhamnaceae) have been noted to produce a variety of characteristic secondary metabolites ranging from cyclopeptide alkaloids that possess antibacterial and antifungal activities, and the dammarane class of triterpenes that are reported as sweetness inhibitor.

MATERIALS AND METHODS

Collection and identification of plant materials

Ziziphus glabrata leaves were collected from the Metala Hills of Namakkal, Tamil Nadu and authenticated by Dr. A. Balasubramanian, Executive Director, ABS Botanical Conservation, Research and Training Centre, Salem. Leaves were subjected to preliminary phytochemical screening.

Preliminary phytochemical screening

The various extracts of Ziziphus glabrata leaves were subjected to preliminary phytochemical screening: 1. Alkaloids: Mayer’s Test: A small quantity of the extract was treated with few drops of dilute hydrochloric acid and filtered. The filtrate was tested with alkaloid Mayer’s reagent. Formation of cream precipitate indicated the presence of alkaloids.

Dragendorff’s Test: To 2-3 ml of the extract added few drops of Dragendorff’s reagent. Formation of orange red (or) reddish brown precipitate indicated the presence of alkaloids.

Wagner’s Test: To 2-3 ml of the extract added few drops of Wagner’s reagent. Formation of reddish brown precipitate indicated the presence of alkaloids.

Flavonoids:

Sodium hydroxide Test: To 2-3 ml of the extract, few drops of sodium hydroxide solution were added in a test
tube. Formation of intense yellow colour that became colourless on addition of few drops of dilute HCl indicated the presence of flavonoids.

**Phytochemicals:**

- **Salkowski Test:** To 2 ml of extract, added 2ml chloroform and 2 ml concentrated sulphuric acid and was shaken well. Appearance of red Chloroform layer and greenish yellow fluorescence acid layer indicated the presence of sterols.
- **Glycosides:**
  - 5 ml of extract was dissolved in pyridine followed by the addition of the freshly prepared sodium nitroprusside solution. The formation of pink to red colour indicated the presence of glycosides.
- **Phenols:**
  - 0.5 ml of ferric chloride solution was added to 2 ml of test solution. Formation of blue-green or red colour indicated the presence of phenols.
- **Tannins:**
  - Small quantity of extract was boiled in 20 ml of water in a test tube and then filtered. A few drop of 0.1% ferric chloride was added and observed for brownish green or blue-black coloration which indicated the presence of tannins.
  - **Benedict’s test:** The extract was treated with Benedict’s reagent and heated for few minutes. Formation of brick red precipitate shows the presence of reducing sugar.
  - **Fixed oils and fats (spot test):**
    - Press a small quantity of powder between two filter papers. Oil strains on the filter paper indicated the presence of fixed oils.

**RESULTS**

In the present investigation, preliminary phytochemical screening has been done in the various extract of *Ziziphus glabrata* leaves and the results are presented in Table-1.

The petroleum ether extract showed the presence of alkaloids, flavonoids, glycosides, steroids and fixed oil and fat. The chloroform extract showed the presence of alkaloids, flavonoids, glycosides, tannin and fixed oil and fat. The benzene and ethyl acetate extract showed the presence of alkaloids, flavonoids, glycosides, steroids, tannin and fixed oil and fat. The ethanol extract showed the presence of alkaloids, flavonoids, glycosides, steroids, phenol, tannin and fixed oil and fat. The results showed the presence of all the phytochemicals in the hydroalcoholic and aqueous extract of *Ziziphus glabrata* leaves.

The results of phytochemical analysis comprehensively validate the presence of therapeutically important and valuable secondary metabolites like alkaloids, flavonoids, phenols, tannins and steroids in *Ziziphus glabrata* leaves.

**DISCUSSION**

- **Alkaloids:**
  - In this study a cream or reddish brown precipitate was observed in petroleum ether, chloroform, benzene, ethyl acetate, ethanol, hydroalcoholic, and aqueous extract of *Ziziphus glabrata* leaves.
  - The alkaloids have been associated with medicinal uses for centuries and one of their common biological properties is cytotoxicity. Alkaloids and its derivatives played important role in analgesic, antispasmodic and bactericidal activities. The alkaloids have been investigated for many pharmacological properties including antiprotozoal, cytotoxic, antiadipatic and anti-inflammatory properties.
- **Flavonoids:**
  - In this study a yellow precipitate (or) cherry red colour was observed in petroleum ether, chloroform, benzene, ethyl acetate, ethanol, hydroalcoholic, and aqueous extract of *Ziziphus glabrata* leaves.
  - Flavonoids are hydroxylated phenolic substance known to be synthesized by plants in response to microbial infection and they have been found to be antimicrobial substances against wide array of microorganisms *in vitro*. Flavonoids have been reported to possess many useful properties, including anti-inflammatory, antiallergic, antioxidant, vascular and antitumour activity.
- **Glycosides:**
  - In this study a pink to red colour was observed in petroleum ether, chloroform, benzene, ethyl acetate, ethanol, hydroalcoholic and aqueous extract of *Ziziphus glabrata* leaves.
  - Glycosides are known to lower the blood pressure according to many reports. Glycosides were reported to exhibit antidiabetic characteristics.
- **Steroids:**
  - The result indicated that a brown ring was formed at the junction of two layers in the petroleum ether, benzene,
ethyl acetate, ethanol, hydroalcoholic and aqueous extract of Ziziphus glabrata leaves.

Steroids have been reported to have antibacterial properties\(^2\). Steroids have been reported to possess anti-inflammatory activities\(^2\). Plant steroids are known to be important for their cardiotoxic properties, possession of insecticidal, anti-inflammatory, analgesic properties, central nervous system activities and antimicrobial properties\(^2\).

Phenols:

The results showed the presence of dark blue colour in ethanol, hydro alcoholic and aqueous extract of Ziziphus glabrata leaves.

The phenolic compounds are one of the largest and most ubiquitous groups of plant metabolites\(^3\). Phenols and phenolic compounds are greatly used in skin infections and other wounds treatment and also for healing, when compared to other bactericides\(^4\). Primarily phenolic compound are of great importance as cellular part of cell wall structure by polymeric phenolics\(^5\). They possess biological properties such as antiapoptosis, angiogenesis and cell proliferation activities, as well as inhibition of angiogenesis and cell proliferation activities\(^5\).

Tannins:

In this study a brownish green (or) bluish-black colour was observed in chloroform, benzene, ethyl acetate, ethanol, hydroalcoholic and aqueous extract of Ziziphus glabrata leaves.

Tannins bind to proline rich protein and interfere with protein synthesis\(^6\). Tannins decrease the bacterial proliferation by blocking key enzymes in microbial metabolism. Tannins act as potent antioxidant. Tannins are reported to be used for treating intestinal disorders such as diarrhea and dysentery\(^7\).

CONCLUSION

The present study attempts to assess the status of phytochemical properties in the leaves of Ziziphus glabrata. This study suggests that ethanol, hydroalcoholic and aqueous extract of Ziziphus glabrata leaves is a promising candidate which could be exploited further to develop as pharmacologically active agents due to their rich phytochemical constituents. Further work should be carried out to isolate, purify, and characterize the active constituents responsible for the activity of Ziziphus glabrata.
